- In case alignment doesn't work through "Tracking Auto" command, users can tune finely through "Manual Tracking".
- "Manual Tracking" window enables users to set Frequency, Phase, LineStart and PixelStart.
- Detail adjustment steps are as follows.

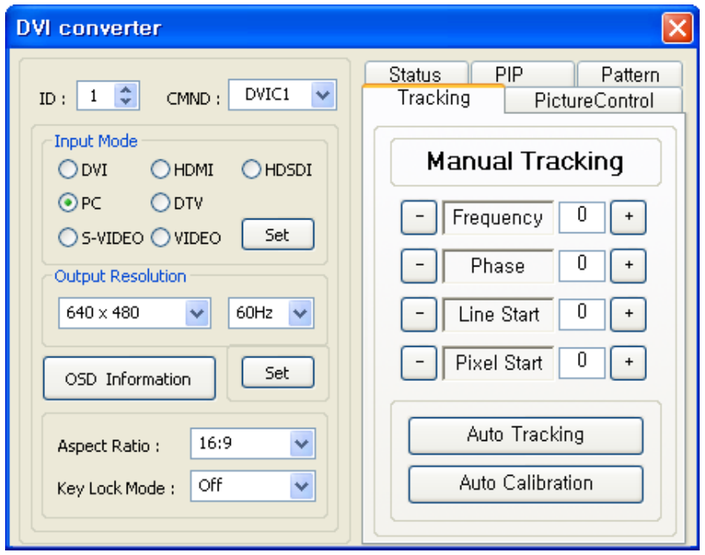
  1) Tune "Phase" until the vertical lines are clearly adjusted..

  2) Tune "LineStart" to adjust vertical alignment. "PixelStart" for horizontal alignment.

  3) Adjust "Frequency" if alignment is still wrong.
  If you adjust "Frequency", repeat step 1) and 2) to fit alignment.
  Adjustable range is as follows

- **Frequency** : The range of "Frequency" you can adjust is –50 to 50
- **Phase** : The range of "Phase" you can adjust is 0 to 63
- **Linestart** : The range of "Linestart" you can adjust is –23 to 10
- **Pixelstart** : The range of "Pixelstart" you can adjust is –50 to 40

- **Auto Tracking** : Automatic alignment for DVI Converter screens.
- **Auto Calibration** : Automatic color control for DVI Converter screen.

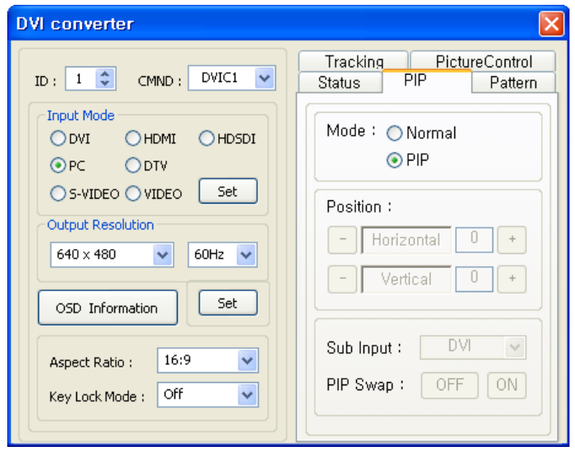


13) PIP(Picture In Picture)

- A variety of images can be displayed with the PIP function of DVI converter. To activate PIP, click "PIP" in the Mode. The position of sub–picture can be controlled by clicking – / + buttons increase or decrease the number or directly type in the numbers at Edit box.
- Various input sources can be used. To set the sub–input, click the sub–input combo box and select sub–input.
- Main screen and sub–screen can be swapped with the PIP Swap function. Press "Set" button at the right side of "PIP Swap." If you want to return to previous screen, press "Normal" button at the right side of "PIP Swap."
- **Mode** : Normal mode – Normal screen without PIP (PIP Off)
  PIP mode–Sub–screen is displayed at the lower right corner of the screen. (PIP On)
- **Position** : Horizontal – Adjust the horizontal location of PIP. Adjustable range 0∼100
  Vertical – Adjust the vertical location of PIP. Adjustable range 0∼100
- **Sub Input** : Set the input for PIP. One of DVI, HDMI, HDSDI, PC, DTV, S–VIDEO, and VIDEO can be selected for sub–input.

  ※ According to the main input, the sub–input can be restricted. If the main input is a digital input such as DVI, HDMI or HD–SDI, the sub–input should be an analog input such as PC, DTV, S–VIDEO or Video. If the main input is an analog input the sub–input should be a digital input.

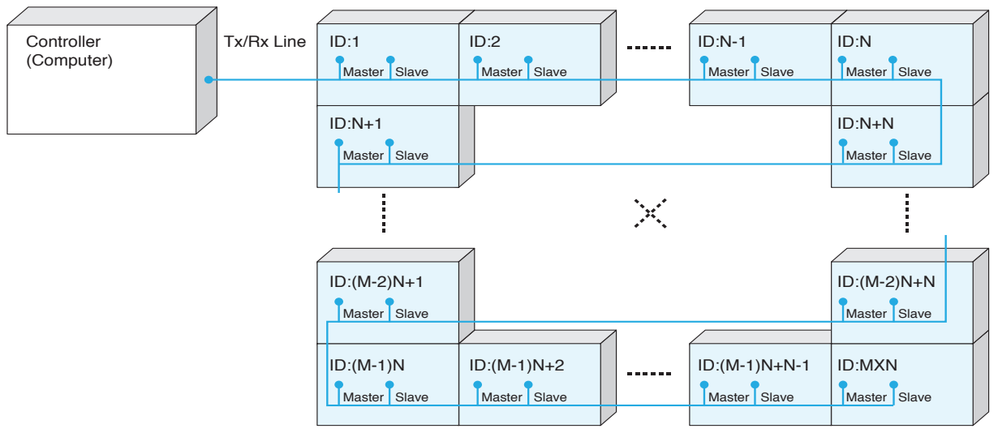
- **PIP Swap** : OFF – Return to previous locations of swapped Main Source Input screen and Sub Source Input screen.
  ON – Exchange the locations of Main Source Input screen and Sub Source Input screen.



7. MSCS Protocol

1. Introduction

This chapter contains the communication protocol between LCD and its control devices such as computer for better use of the product. However, it does not include detailed technical matters. It rather focuses on the brief functional explanation and communication protocol.



※ The connection can be variable based on environment or the users' intention.

〈 Communication connection diagram 〉

1.1. Communication Setting

- Transmission & Reception type: Asynchronous Serial Communication
- Connection type: Daisy Chain
- Baudrate : 115200
- Data Bits : 8
- Parity : None
- Stop Bits : 1
- Flow Control : None

2. Protocol Format

2.1. Send To LCD

STX	Command	Length	Data	ETX
1 byte	1 byte	1 byte	Variable	1 byte

ID	Master	Other Data
1 byte	1 byte	N byte

- This is how to send commands to LCD. Only the set of the designated ID is working according to the "Command." But, if the "ID" value is "0", all MLCD sets are working according to command as "Broadcast".
- STX(0x02): The initial code. It means the beginning of Protocol. (Fixed value)
- Command: Code for actual operation. (Variable)
- Length: the length of "Data" area. (Variable: 0~255)
- Data: the areas for "ID" and the other Data (Variable)
- ID: It is a code to distinguish LCD sets. Its range is "0" to "255". If the ID is "0," it means Broadcast command.(variable)

- Master(0x01) : This is the scaler code.
- ETX(0x03): The end of the code. (Fixed value)

2.2. Receive From LCD

STX	CMD	Length	Data	Check Sum	ETX
1 byte	1 byte	1 byte	Variable	1 byte	1 byte

ID	Master	Other Data
1 byte	1 byte	N byte

- Response by a certain command from the designated set among MLCD sets. The difference from "Send to LCD" is "Check sum".
- STX(0x02): The initial code. It means the beginning of Protocol. (Fixed value)
- Command: Code for actual operation. (Variable)
- Length: the length of "Data" area. (Variable: 0~255)
- Data: the areas for "ID" and the other Data (Variable)
- ID: Set identification (0~255) (Variable)
- Master(0x01) : This is the scaler code.
- Check sum: execute "Not" operation after adding all the values in "STX~Data" area.
- ETX(0x03): The end of the code. (Fixed value))

- Communication Sequence
  * Wait for 50msec for response after sending the command. If there is no response, it is recommended to resend the command.
  * It is recommended that not sending the other command or changing input resolution during command transmission.

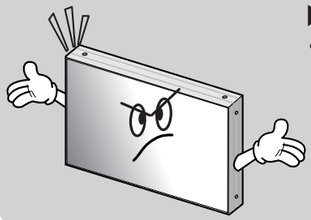
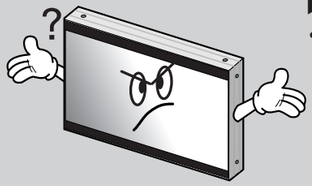
8. Before calling for service

Before calling for any repair, check the following and then refer to a near A/S center.



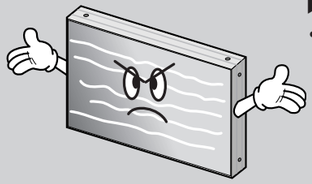
▶"Tick" sound from the main body.

• If there is no problem with the screen or sound, the "tick" sound is likely to result from the cabinet lightly shrinking with the change of room temperature. The sound does not affect product' s performance.



▶No image at upper and lower part of the screen.

• As for a screen which is over 16:9 in width (such as cinema-sized one), no image may be displayed at upper and bottom part of the screen.



▶Speckles or white lines on the screen

• Check whether the problem is caused by vehicle, streetcar, high-voltage cable or neon sign, which emitting interference wave or electromagnetic induction. Avoid any interfering object.
